

# **A Modern Approach to Buying Academic eBooks**

**Paper given at the National Acquisitions Group Seminar 'Balancing the Books: Acquiring and Budgeting for E-Content in the Academic Library', London, 16th May 2006 and published in 'Taking Stock' Summer 2006**

**Mark Howard**

To date it has become the norm for libraries to acquire ebooks by licensing defined bundles and by paying an annual subscription to access the bundle's contents. Some of the ebooks in the bundle may be in high demand others much less so. Dawson Books offers a different model via the EBook Library platform.

Under the Dawson model books are purchased outright for perpetual ownership (like printed books). This means that a library can build a collection title-by-title in the knowledge that the book, once bought, remains theirs. This method of acquisition also overcomes the problem of not knowing for certain that funds required to maintain subscriptions will be forthcoming in future years.

Selection of ebooks is also made easy for Dawson customers already in the habit of researching printed books using the enterBooks database. The ebook catalogue, currently 32500 titles and rising, has been fully integrated into enterBooks. This allows librarians to place orders for ebooks in exactly the same way as orders for printed books (and at the same time if necessary).

In the same way that Dawson currently supplies MARC records for printed books, a MARC record for each ebook is also supplied electronically with an embedded URL linking the record direct to the newly acquired ebook.

As a library builds up a collection of ebooks, individual titles may be located from the library OPAC or, alternatively, the entire collection can also be viewed in the EBook Library web portal. Some libraries might also want to make visible to patrons ebooks not currently owned by the library but available for future purchase. This allows a reader to request access to an ebook via a short-term rental. This is a cost-effective alternative to an inter-library loan. The librarian has the option to implement such a rental service with or without their mediation. So, the librarian decides whether they need to give authorisation or not for the rental to occur.

Taking the stage a step further there is also the opportunity to offer a demand-driven acquisitions procedure whereby a list of likely ebooks is pre-selected (but not bought). These are made visible to library patrons who request access as required. The first two requests might be fulfilled by temporary rentals but the third request triggers an outright purchase and the ebook becomes a permanent part of the library's collection. This has proved popular where funds are available but staff resources are limited. It allows a collection to grow safe in the knowledge that books acquired are definitely needed.

Finally, the detailed provision of usage statistics that show which ebooks were read, when, and for how long, adds to this sophisticated and comprehensive alternative to ebook collection development. It is a new approach that has found favour in many institutions, large and small, in the UK and further afield.
